

Maxence Roques

Software Engineer - Full-stack - AI - HCI

I design software products that connect technical architecture, business interfaces and artificial intelligence. My guiding principle is to turn complex systems into tools that are understandable, traceable and genuinely useful.

React / Node Full-stack	AI / LLM Applied AI	UX / HCI User-centered	Sep 2026 Available

PROFILE

A cross-functional profile spanning software, AI and user needs

My computer engineering background is complemented by an HCI specialization and projects centered on data, automation and business systems.

Build

Web applications, backend services, business interfaces, API integrations and automations, with an end-to-end view from data to user interaction.

Make reliable

Versioning, deployment, rollback, testing, error handling and AI evaluation: quality is a product property, not a final-stage activity.

Design for use

My HCI specialization leads me to start from real tasks, reduce cognitive load, prevent user errors and validate solutions through feedback and usage measures.

Core skills

React / Angular Front-end	Node / Java / Python Back-end	Mistral / n8n AI & automation	Kafka / Redis / Docker Systems
-------------------------------------	---	---	--

Neylia - Operating and improving AI features in a business SaaS product

Final-year internship on an HR SaaS platform embedding AI in several business workflows. The work combined control interfaces, AI-configuration governance, user feedback and continuous evaluation.

~50 AI configurations	7 n8n workflows	3 key interfaces	10 x 10 tests/scenario
---------------------------------	---------------------------	----------------------------	----------------------------------

Key contributions

- Designed a real-time React dashboard fed by WebSocket, Kafka and Redis.
- Implemented the AI configuration lifecycle: versioning, publishing, deployment, rollback and synchronization.
- Built an AI Lab orchestrated by n8n with Mistral Batch, benchmarks and automated judges.
- Improved document-enrichment and candidate-opportunity scoring workflows with user feedback in the loop.

Engineering / product insight

The key outcome was continuity between configuration, execution, feedback, reproduction, evaluation and deployment rather than isolated tools.

Stack: React, Node.js, Mistral AI, n8n, WebSocket, Kafka, Redis, Zod

Juno - An action-oriented job-search copilot

Juno is a personal product built from a concrete problem: job opportunities, follow-ups, documents, contacts and interview context quickly become fragmented. The product is designed around the next useful action rather than a passive status table.

68+ real applications	6 product phases	28 days field validation	<90 s entry-time target
---------------------------------	----------------------------	------------------------------------	--------------------------------------

Key contributions

- Built a daily dashboard, Kanban pipeline, calendar, follow-ups and inactivity alerts.
- Modeled companies, opportunities, applications, contacts, documents, interviews and event history.
- Added job import, CV adaptation, drafts, interview preparation and configurable opportunity scoring.
- Kept human validation mandatory before messages or sensitive actions.
- Designed a relational architecture using Cloudflare D1 / SQLite and Drizzle ORM.
- Set up quality checks with Playwright, linting, type checking, unit/integration tests and build verification.

Engineering / product insight

A 28-day field-validation protocol measures adoption, entry time and recurring friction before additional automation or AI is introduced. Repository: github.com/MaxenceRoques/job-hunting

Stack: React 19, Next.js 16, TypeScript, Drizzle ORM, Cloudflare D1, Playwright

GECOS - Building-management alert supervision and multi-channel routing

Engineering project for technical teams. The objective was to bridge anomaly detection and actual field resolution by making raw alerts understandable, persistent and routable into operational tools.

6 PHP plugins	4 target channels
-------------------------	-----------------------------

Key contributions

- Gathered needs directly from technical services and compared candidate solutions.
- Designed a containerized modular service to receive, aggregate and persist InfluxDB alerts.
- Implemented resilient routing to Kanboard, Slack, Microsoft Teams and SMS with automatic error recovery.
- Developed six PHP plugins to adapt Kanboard to real operational workflows.
- Iterated on terminology, state visibility and interaction continuity using user feedback.

Engineering / product insight

Adapting an existing tool can be more valuable than rebuilding from scratch when user pain points are precisely understood.

Stack: PHP, Docker, InfluxDB, Flux, SQLite, Telegraf, Kanboard, APIs

DNIIT - AI-based fire-risk prediction prototype

Independent international internship covering an end-to-end AI problem: preparing data, training a predictive model, evaluating outputs and presenting risk information through a web interface.

Key contributions

- Analyzed available data and prepared features for model training.
- Trained and evaluated Random Forest models for fire-risk prediction.
- Built a React dashboard to visualize and monitor risk levels.
- Managed the project independently in an international environment.

Engineering / product insight

A model creates value only when its output, uncertainty and meaning are presented in a form that supports a user decision.

Stack: Python, React, Random Forest, Data Analysis

Multiplayer Tron game - Web development and AWS

Team-built web application inspired by Tron, combining social features, gamification, local and online modes, an AI-controlled opponent and cloud deployment.

Key contributions

- Developed the friends system and gamification mechanics.
- Implemented local and online game modes.
- Integrated an AI-controlled opponent.
- Deployed the multiplayer application on AWS.
- Coordinated integration of features developed by multiple team members.

Engineering / product insight

This project strengthened my ability to combine application logic, user experience, team integration and deployment concerns.

Stack: HTML, CSS, JavaScript, AWS

SKILLS & CONTACT

A toolkit built through concrete products

Front-end

React, Angular, JavaScript, TypeScript, HTML5, CSS, Svelte

Back-end

Node.js, Java, Spring, Python, PHP, APIs, WebSocket

AI & automation

Mistral AI, n8n, prompt engineering, LLM-as-a-Judge, test datasets, Random Forest

Systems & data

Kafka, Redis, Docker, AWS, InfluxDB, SQLite, Drizzle ORM, Cloudflare D1

UX / HCI

User-centered design, interviews, accessibility, error prevention, feedback and iterative improvement.

Education

2023-2026 - Computer Engineering degree, Human-Computer Interaction specialization - Polytech Nice Sophia

Languages

French: native - English: fluent - German: intermediate

LOOKING FOR

A full-time software engineering / full-stack position from September 1, 2026, with genuine product and architecture challenges, ideally around Sophia Antipolis / Nice or in a compatible hybrid environment.
